Objective: Identify the constant of proportionality and write in equation form.

## Vocabulary

Proportional Relationship: a relationship between two equal ratios

$$
\frac{5 \text { apples }}{2 \text { dollars }}=\frac{20 \text { apples }}{8 \text { dollars }}
$$

Written form is $\boldsymbol{y}=\boldsymbol{k x}$; where $\boldsymbol{k}$ is constant, using the ordered data pairs ( $x, y$ ).

Constant of Proportionality: the factor multiplied by the $x$-value to get the corresponding $y$-value. The unit rate and constant of proportionality both represent the value of the ratio of $y: x$.

$$
y=k x
$$

$k$ is the constant of proportionality.

$$
k=\frac{y}{x}
$$

## Steps:

To find the constant of proportionality, use the following:

Table: convert one entry to a ratio; the equivalent fraction with 1 in the denominator is the constant of proportionality.

Coordinate Plane: write one coordinate $(x, y)$ as the fraction $\frac{y}{x}$; the equivalent fraction with 1 in the denominator is the constant of proportionality.

Linear Equation $\boldsymbol{y}=\boldsymbol{k x}$ : the coefficient $\boldsymbol{k}$ is the constant of proportionality.

Verbal Description: the constant of proportionality is the unit rate.

## Homework

Unit 3 - Lesson 9: Gonstant of Proportionality

## Example \# 1

## Example \# 2

Directions: Identify the constant of proportionality and create an equation that represents the relationship.

The amount of sugar needed for a cookie recipe is proportional to the number of cookies, as shown in the table. What is the constant of proportionality?

| Sugar (tbsp) | Cookies |
| :---: | :---: |
| 2 | 12 |
| 3 | 18 |
| 4 | 24 |

## Solution:

- Identify the unit rate using words: $\frac{\text { cookies }}{\text { tbsp sugar }}$
- Identify the given ratios: $\frac{\text { cookies }}{\text { tbsp sugar }} \rightarrow \frac{12}{2}, \frac{18}{3}, \frac{24}{4}$
- Identify the unit rate: $\frac{12}{2}=\frac{6}{1}, \frac{18}{3}=\frac{6}{1}, \frac{24}{4}=\frac{6}{1}$
- The constant of proportionality is $\frac{6}{1}$ or 6 .
- The equation to represent this proportional relationship is: $y=6 x$.

The graph below shows Jerry's earnings for coffee sales. Find and interpret the constant of proportionality.

## Solution:

- Identify the units being used: He earns $y$ dollars for $x$ coffee sales.
- Unit rate in words: $\frac{y \text { dollars }}{x \text { coffee sales }}$.
- Identify the unit rates for each given data point, $\frac{100}{5}=\frac{20}{1}$ and $\frac{200}{10}=\frac{20}{1}$.
- The constant of proportionality for the given data points is $\frac{20}{1}$.
- The unit rate means that Jerry earns $\$ 20$ per coffee sale.
- The proportional relationship between what Jerry earns for coffee sales can identified by the equation $y=20 x$.
$\qquad$

## Date:

Directions: Determine the constant of proportionality and create an equation.

1. The amount of oil needed for a bread recipe is proportional to the quantity of nuts, as shown in the table.

| Oil <br> $\boldsymbol{x}$ | Nuts <br> $\boldsymbol{y}$ | $\frac{\boldsymbol{y}}{\boldsymbol{x}}$ |
| :---: | :---: | :---: |
| 2 | $\frac{1}{3}$ |  |
| 3 | $\frac{1}{2}$ |  |
| 4 | $\frac{2}{3}$ |  |

3. The number of miles that Matt bikes is proportional to the number of hours that he rides.

| Miles <br> $\boldsymbol{x}$ | Hours <br> $\boldsymbol{y}$ | $\boldsymbol{y}$ <br> $\boldsymbol{x}$ |
| :---: | :---: | :---: |
| 4 | 6 |  |
| 18 | 27 |  |
| 12 | 18 |  |

2. The graph below shows the proportions of sugar to flour in Fran's cake recipe.

3. The graph shows a proportional relationship between $y$ and $x$.

4. The price of a poster is proportional to its area.

5. The amount of beans needed for a soup recipe is proportional to the amount of water. Two cups of lentils are needed for every eight cups of water.

Explain the steps you used to solve problem number $\qquad$ .
